

With this proposal we try to raise awareness about the importance and need of the different natural reserves around the world, that contribute to the preservation of endangered species, whilst also protecting certain climatic areas and ecosystems, ensuring the optimal ambience for the development and breeding of these species. With this, natural reserves and associated entities take part in the conservation of worldwide biodiversity, both to flora and fauna.

It is important for us humans to invest in them as biodiversity and specimen loss are problems occurring worldwide and that affect us all due to the globalization of our societies, as species disappearing affect individual ecosystems and therefore the whole world at a greater scale.

It is important to raise this awareness in children as they will be the ones inheriting the Earth and therefore the ones that will be in charge of promoting this sustainable and preserving actions.

The development of this proposal hasn't been an easy path, as we would usually feel confused and lost in the different parts of it. Some of them were practically impossible to achieve, as we could not contact any local school in Burkina-Faso due to the lack of ICT resources in their installations. Moreover, as this project is supposed to be developed linearly, with one step following the previous, it was really difficult to share different points and focus only on one aspect each.

In addition to this, it must be said that we haven't been able to keep this work on a daily basis following the schedule created by the teacher, as it appeared as impossible for us to all meet during the classes in

This has lead to some unequal workload for the different members of the group, resulting in some of us working really really hard and others barely completing halve of one point or area of the proposal. Overall, we would mark ourselves our work with a mark between 7.5 - 8.5.
